

Recycled Glass Products

Why is recycling glass so important?

Recycled glass uses less energy during its recycling process. According to the New York Department of Environmental Conservation, recycled glass requires **40 percent less energy** than making it from all new materials. Recycling glass reduces emissions, saves energy, and reduces consumption of raw material. The number is much higher in states with bottle bills which have a beverage container recycling rate of around **60%**, while non-deposit states only reach about **24%**.

Here are just a few of the many benefits of recycling glass:

Reduces air pollution by 20% over making new glass.

Reduces water pollution by 50% over making new glass.

Reduces space in landfills.

A glass container can go from a recycling bin to a store shelf in as little as 30 days.

Saves energy needed to create new glass.

Making products from recycled glass consumes 40% less energy than making new glass.

Conserves natural resources.

Every ton of glass that is recycled saves more than a ton of raw materials needed to create new glass.
